

PERFECT CONDITIONS FOR MELANOMA

Most young Aussies think they probably should do more to protect their skin from the sun. They're right.

You don't have to burn to get a melanoma. You don't even have to tan. Just 1mm deep, a melanoma can get into your bloodstream and spread. So even if it is cut out, the cancer can return months or years later, often in your lung, liver or brain.

There's nothing healthy about a tan.
